This assignment has been uploaded as a two repositories in GitHub. The name of repositories are pure-sea-api and pure-sea-ui. The first repository is responsible for the backbone of the assignment while the second repository is for the UI.

The UI was implemented by Angular while the backbone was coded using Type Script.

For crawling CNN news, I used a free API which is called news API. For crawling twitter, the Twitter's API was used, however, since this was free version of API it did not show all the twits from the timeline of a particular person. This is the reason why the website does not show all the REALDONALTRUMP twits.

For uploading the project in the web HEROKU was used.

The website shows CNN news article about anything or anyone you want. All need to do is just entering the key word and press the search. It is the same for twits as well. This is the feature I add to the project.
